## Proof

#### Max cardinality matching in  $G \leq$  value of maxflow in  $G'$

- $\blacktriangleright$  Given a maximum matching *M* of cardinality *k*.
- $\blacktriangleright$  Consider flow *f* that sends one unit along each of *k* paths.
- $\blacktriangleright$  *f* is a flow and has cardinality *k*.

# 12.1 Matching

### Which flow algorithm to use?

- *►* Generic augmenting path:  $O(m \text{ val}(f^*)) = O(mn)$ .
- ▶ Capacity scaling:  $O(m^2 \log C) = O(m^2)$ .
- $\blacktriangleright$  Shortest augmenting path:  $\mathcal{O}(mn^2)$ .

For unit capacity simple graphs shortest augmenting path can be implemented in time <sup>O</sup>*(m*<sup>√</sup> *n)*.

## A graph is a unit capacity simple graph if **P** every edge has capacity 1 ▶ a node has either at most one leaving edge or at most one entering edge

12.1 Matching

## Proof

Max cardinality matching in  $G \geq$  value of maxflow in  $G'$ 

- $\blacktriangleright$  Let *f* be a maxflow in *G'* of value *k*
- $▶$  Integrality theorem  $\Rightarrow$  *k* integral; we can assume *f* is 0/1.
- $\blacktriangleright$  Consider *M* = set of edges from *L* to *R* with  $f(e) = 1$ .
- *ñ* Each node in *L* and *R* participates in at most one edge in *M*.
- $\blacktriangleright$   $|M| = k$ , as the flow must use at least *k* middle edges.

# Baseball Elimination

#### Which team can end the season with most wins?

- ▶ Montreal is eliminated, since even after winning all remaining games there are only 80 wins.
- ▶ But also Philadelphia is eliminated. Why?

## Baseball Elimination

Formal definition of the problem:

- *<sup>ñ</sup>* Given a set *S* of teams, and one specific team *z* ∈ *S*.
- $\blacktriangleright$  Team *x* has already won  $w_x$  games.
- $\blacktriangleright$  Team *x* still has to play team *y*,  $r_{xy}$  times.
- $\triangleright$  Does team *z* still have a chance to finish with the most number of wins.

## Baseball Elimination

Flow network for  $z = 3$ . *M* is number of wins Team 3 can still obtain.

Idea. Distribute the results of remaining games in such a way that no team gets too many wins.

#### Theorem 1

*A team z is eliminated if and only if the flow network for z does*  $\bm{n}$ ot allow a flow of value  $\sum_{ij \in S \setminus \{z\}, i < j} r_{ij}$ .

### Proof  $($   $\Leftarrow$   $)$

- *ñ* Consider the mincut *A* in the flow network. Let *T* be the set of team-nodes in *A*.
- $\blacktriangleright$  If for node  $x \cdot \nu$  not both team-nodes x and  $\nu$  are in T, then  $x-y \notin A$  as otw. the cut would cut an infinite capacity edge.
- ▶ We don't find a flow that saturates all source edges:

#### $r(S \setminus \{z\})$  > cap $(A, V \setminus A)$

≥ X *i<j*: *<sup>i</sup>*∉*T*∨*j*∉*<sup>T</sup>*  $r_{ij}$  +  $\sum$ *i*∈*T*  $(M - w_i)$  $\geq r(S \setminus \{z\}) - r(T) + |T|M - w(T)|$ 

 $\blacktriangleright$  This gives  $M < (w(T) + r(T))/|T|$ , i.e., *z* is eliminated.

## Baseball Elimination

#### Proof  $($ ⇒)

- ▶ Suppose we have a flow that saturates all source edges.
- **► We can assume that this flow is integral.**
- **For every pairing**  $x \cdot y$  **it defines how many games team**  $x$ and team  $\gamma$  should win.
- $\blacktriangleright$  The flow leaving the team-node *x* can be interpreted as the additional number of wins that team *x* will obtain.
- *i* This is less than *M* − *w*<sub>*x*</sub> because of capacity constraints.
- **▶ Hence, we found a set of results for the remaining games,** such that no team obtains more than *M* wins in total.
- **►** Hence, team *z* is not eliminated.

# Project Selection

#### The prerequisite graph:

- $\rightarrow \{x, a, z\}$  is a feasible subset.
- $\blacktriangleright$  {*x, a*} is infeasible.

# Project Selection

#### Project selection problem:

- $\triangleright$  Set *P* of possible projects. Project *v* has an associated profit  $p_v$  (can be positive or negative).
- $\triangleright$  Some projects have requirements (taking course EA2 requires course EA1).
- $\triangleright$  Dependencies are modelled in a graph. Edge  $(u, v)$  means "can't do project *u* without also doing project *v*."
- **★** A subset *A* of projects is feasible if the prerequisites of every project in *A* also belong to *A*.

Goal: Find a feasible set of projects that maximizes the profit.

12.3 Project Selection

## Project Selection

#### Mincut formulation:

- **F** Edges in the prerequisite graph get infinite capacity.
- Add edge  $(s, v)$  with capacity  $p_v$  for nodes *v* with positive profit.
- *►* Create edge  $(v, t)$  with capacity  $-p<sub>v</sub>$  for nodes *v* with negative profit.
